ABOUT:

I completed a 5-year Integrated Master’s in Technology in Artificial Intelligence and Machine Learning, where I built a strong foundation in AI, ML, and data analytics. I’m currently pursuing my M.S. in Computer Science with a specialization in Data Science at the University of Missouri-Kansas City. My experience spans data science, machine learning, and cloud-based development using Python, AWS, and DevOps tools. I enjoy building scalable, data-driven solutions that connect analytics with real-world applications.

EDUCATION:

University of Missouri Kansas City, MS in Computer Science	Aug 2024 – Present
Vellore Institute of Technology, Bhopal, Master of Technology in AI & ML	Aug 2019 – May 2024

EXPERIENCE:

Salesforce Developer Intern	AICTE	May 2023 – July 2023
- Customized Salesforce CRM applications using data models, workflows, and Lightning Components. - Implemented automation rules and process flows to streamline repetitive business tasks. Applied Apex fundamentals to integrate declarative and programmatic customization.		
AWS DevOps Intern	SmartBridge	June 2021 – Aug 2021
- Automated EC2 and EKS cluster provisioning using Terraform within Jenkins pipelines. - Containerized applications with Docker and deployed via docker-compose on AWS. Practiced CI/CD and infrastructure-as-code for reliable cloud deployments.		

PROJECTS:

Multi-Label Image Classification (Graph-STN):
- Developed a hybrid CNN + graph model for multi-label image prediction using label co-occurrence. - Enhanced mAP and F1 scores through spatial transformer layers and data augmentation, achieving approximately 15 % higher classification consistency than the CNN baseline.
Intelligent Album Manager:
- Built a face-recognition-based photo sorting system deployed on AWS with CI/CD automation. - Designed configurable thresholds and batch pipelines for scalable operation, delivering around 95 % face-match accuracy and reducing manual organization effort by 80 %.
Credit Card Fraud Detection:
- Handled class imbalance using SMOTE and weighted models while evaluating performance with PR-AUC and recall metrics. - Integrated SHAP-based explainability to identify key fraud indicators, improving recall by 18% with minimal false positives.
Multi-Agent Medical Fact-Checking and Evidence Explorer:
- Developing a multi-agent AI system for automated medical fact-checking and evidence exploration. The platform retrieves and ranks biomedical literature using FAISS based semantic search, applies OpenAI GPT models for context aware summarization, and generates structured verdicts with confidence scores and citation mapping. - It includes a Reddit-integrated bot that continuously monitors medical discussions, detects health-related claims, and posts fact-checked replies with evidence and references in real time. - The system runs on modular architecture with Streamlit for front-end interaction and AWS/GCP services for retrieval, model inference, and visualization workflows.

TECHNICAL SUMMARY:

Languages:	Python, SQL.
Cloud & DevOps:	AWS, GCP, Databricks, Docker, Kubernetes, Terraform, Jenkins, Git.
Databases & Storage:	MySQL, SQL Server, S3
Visualization & Tools:	Tableau, Power BI, VS Code
